

Enables you to design or amend message templates that can be shared with business partners. Templates can be uploaded to the DTS enabling you to conduct end to end tests of upcoming catalogue changes and new industry requirements or to carry out bi-lateral information sharing with business partners

## FlowBuilder

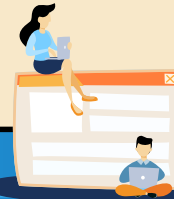

Feedback told us that energy market participants find the change process slow and unwieldy and that when changes are made they can generate a lot of additional work.

### THE CHALLENGE

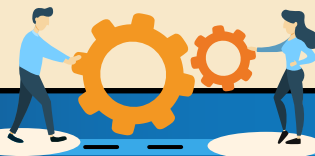

1

One of our DTS Users wanted to test the impact of a new message being added to the Data Transfer Catalogue (DTC) on their systems before the new message was published.

2

### HOW WE COULD HELP

3

### OUTCOME

Using the FlowBuilder created template the DTS User loaded the flow into their internal systems thereby reducing development and testing overheads. This approach has given them confidence that they would be able to successfully receive and process the new flows without any costly re-work once the catalogue has been published.

FlowBuilder enables market participants to test upcoming catalogue changes. In this case we pro-actively created a new message template to mirror the upcoming new DTC flow. The new template was available on the D-FlowMaster tool for Users to build new flows and then send them over the DTS, or load them into their systems for end to end testing.
